AMENDMENT TO THE SPECIFICATION

Please amend the paragraph beginning on page 7, line 21 as follows:

Referring to Fig. 2, in step S201, storage unit 103 stores a content to be reproduced. In step S203, control unit 101 performs data evaluation of the content to be reproduced. Specifically, complexity of the content is calculated. If the complexity obtained is less than the upper limit of complexity processible by the terminal, the content is reproduced in step S205.

If it exceeds the upper limit of processing capability of the terminal, some functions of the terminal are invalidated to make part of the content not displayed (branch S204), and complexity is calculated again (step S203). The process is repeated to calculate the complexity with which the content can be reproduced without exceeding the processing capability. When the relevant complexity is obtained, reproduction is performed. Otherwise, reproduction is not effected.
